

***Before product development,
there's the endless climb of
backlog refinement.***

Current Process: Request Initiation

Current Process: Task Categorization

Classification

Based on the request's complexity, it is broadly classified as either a bug or enhancement.

All requests follow these standard flows.

Bug

Either declined, moved to Epic or expedited for resolution

Enhancement

Presented in biweekly call to assign priority and assigned to product owner to take ahead

Main Problems and Issues Identified

PM Bottleneck + Rework

Pain: PMs spend significant time cleaning and reworking submissions.

Evidence: Requesters can't edit submissions, so incomplete items flow directly to PM.

No Categorization

Pain: One-size-fits-all form causes delays and missing data.

Evidence: 15+ request types share one form, complex types lack required fields

Missing Routing Logic

Pain: PMs manually determine reviewers and approvers.

Evidence: Intake form does not capture source, platform, or approvers.

Ineffective Prioritization

Pain: Work not sequenced against existing backlog.

Evidence: New items create a "new backlog"; enhancements slowed by multi-step approval chain.

Volume Outpacing Capacity

Pain: Rising volume exceeds process bandwidth.

Evidence: Averaging 10+ requests/day; high-volume simple forms are mixed with complex ones.

Duplicated Effort

Pain: Requesters lack status insight and often resubmit.

Evidence: No automated updates; limited SLA-tracking fields.

Solutions proposed

01

Improve the intake process

- Ensure all tickets enter the system with the right level of detail, correct routing, and required approvals—reducing rework, delays, and compliance risk.

02

Improve the Handling Process
After Intake (Workforce &
Workflow Optimization)

-
- Reduce the handoff in between teams by automatically assigning the tasks to the right teams
- Match work to the right skill set

03

Introduce an Automated
AI/Agent Layer

- Auto-categorize incoming requests based on description
- Auto-suggest priority (based on business rules, criticality)
- Summarize long descriptions into structured fields

AI-Powered Request Intake & Resolution Flow

1. User Submits Ticket

- Uploads text, screenshots, data
- Entry point to automated workflow

2. MCP Agent – Summarizer

- Generates clean 2–3 line summary
- Normalizes terminology across teams

3. MCP Agent – Ticket Classifier

- Categorizes: Bug / Enhancement / Access / UW / Funding Blocker / Data issue

4. MCP Agent – Priority Scorer

- Assigns P1–P4 based on impact, workflow stage, and user groups

AI-Powered Request Intake & Resolution Flow

5. Automated System Actions

- Auto-create Jira ticket / Slack alert
- Optional auto-fix via Airflow DAG

6. Human-in-the-Loop

- PM reviews edge cases
- Overrides summary / category / priority if required

7. Final Execution & Dashboard

- Airflow executes workflows
- Streamlit dashboard displays SLA, metrics, and trends

Solution flow architecture
